Demographic Indicators

Highlights

Demographic characteristics of a country provide an overview of its population size, composition, territorial distribution, changes therein and the components of changes such as nativity, mortality and social mobility. This section on demographic indicators has been subdivided into two parts- Population Statistics and Vital Statistics. Population statistics include indicators that measure the population size, sex ratio, density and dependency ratio while vital statistics include indicators such as birth rate, death rate, and natural growth rate, life expectancy at birth, mortality and fertility rates. These indicators for the country as well as states will help in identifying areas that need policy and programmed interventions, setting near and far-term goals, and deciding priorities, besides understanding them in an integrated structure. Data in this section has been taken mainly from the “Census of India”.

- India's population, as per census 2011 stood at 12108.5 lakhs (6232.7 lakhs males and 5875.8 lakhs females). Out of the entire census till date, the Average Annual Exponential Growth Rate has been negative only for the decade 1911-21. During this interval, population declined marginally due to great influenza epidemic and two successive bad harvests in West Bengal. [Table No. 1.1.1]
- The sex ratio of India during 1901 was 972 females per 1000 males. Since then, it has continued to decline decade over decade to 926 females against 1000 male in 1991 (except in 1981). The sex ratio has further improved from 1991 it was 933 and 943 female against 1000 female in 2001 and 2011 respectively in the country as per the information available at Table No. 1.1.1 and graphic presentation given at Figure No. 1.1.2. According to Figure No. 1.1.1, the sex ratios of 18 States/UTs were above national average while 17 States/UTs have registered below national average.
- The highest sex ratio of 1084 females per 1000 males was reported by State of Kerala followed by Puducherry (1037/1000), Tamil Nadu (996/1000), Andhra Pradesh (993/1000), Chhattisgarh (991/1000) and Meghalaya (989/1000). The lowest sex ratio of 618 females per 1000 males was reported by the UT of Daman & Diu followed by Chandigarh (818/1000), NCT of Delhi (868/1000), Andaman & Nicobar Islands (876/1000), Haryana (879/1000), Jammu & Kashmir (889/1000), Sikkim (890/1000) and Punjab (895/1000). [Refer Table No. 1.1.2]
- The graphic representation of the population density of the country is given at Figure No. 1.1.3. The highest population density of 11320 populations per square kilometre was reported by NCT of Delhi whereas Arunachal Pradesh has reported the lowest population density of 17. [Refer Table No. 1.1.2]
- Age group-wise distribution of population of the country projected for 2014 and 2015 are given at Table No. 1.1.4(a) and Table No. 1.1.4(b) respectively. Accordingly to Table No. 1.1.4 (b), 27.3% of the total projected population of 2015 were below the age of 14 years and majority (64.4%) of the population were in the age group of 15-59 years i.e. economically active population and 8.5% population were in the age group of 60 to 85+ years.
- The estimated Birth Rate, Death Rate and Natural Growth Rate in India during 1991 to 2015 are given in Table No. 1.2.1. There has been consistent decrease in the Birth Rate, Death Rate and Natural Growth Rate in India since 1991 to 2015. As on 2015 India has registered Birth Rate of 20.8 per 1000 populations and Death Rate of 6.5 per 1000 populations while the Natural Growth Rate was 14.3 per 1000 population in India. The Birth Rate in Rural was higher than in the Urban. Similarly, the Death Rate and Natural Growth Rate were also higher in rural as compared to the Urban.

- The population, however, continues to grow, as the decline in the birth rate is not as rapid as the decline in the death rate.
- The Life Expectancy of Life at Birth has increased from 49.7 years in 1970-75 to 67.9 years in 2010-14. For the same period, the Life Expectancy for Females is 69.6 years and 66.4 years for Males. [Table No. 1.2.6 (b)]
- Infant Mortality Rate has declined considerably (37 i.e. Per 1000 Live Births in 2015), however differentials of rural (41) & urban (25) are still high. [Table No. 1.2.7]
- As per the latest data available, Maternal Mortality Ratio is highest in Assam & lowest in Kerala. [Table No- 1.2.9]
- The Age-specific death rate is declining over the years; the rural-urban differentials are still high. [Table No. 1.2.11(b)]
- The Total Fertility Rate (TFR) for the country was 2.3 whereas in rural areas it has been 2.5 and it has been 1.8 in urban areas during 2015 as per the latest available information. [Table No. 1.2.12]

2. For working out density of India and the State of Jammu & Kashmir, the entire area and population of those portions of Jammu & Kashmir which are under illegal occupation of Pakistan and China have not been taken into account.
3. For Census 2011, the population of "Others" has been clubbed with the "Males" for working out population, 0-6 population, literates and relates rates and ratios.
4. In working out 'decadal variation' and percentage decal variation' for 1941-1951 & 1951-1961 of India and Nagaland State, the population of Tuensang District for 1951(7.025) & the population of Tuensang (83,501) & Mon (50,774) districts for 1961 Census have not been taken into account as the area was censused for the first time in 1951 and the same are not comparable.
