3.1.2.9	Odds Ratio / Risk Ratio associated with Diabetes as Risk Factor	106
3.1.2.10	Attributable Risk Due to Diabetes	107
3.1.2.11	State/UT wise Estimated Prevalence of Blindness in India 2004 (Latest)	108
3.1.2.12	State/UT wise Estimated Incidences of Blindness in India 2004 (Latest)	109
3.1.2.13	Indicies of Burden of Cancer in 2004	110
3.1.2.14	Crude Rate (CR), Age adjusted Rate (AAR) and Truncated(TR) incidence Rates per 100,000 population in different PBCR (2004-2005) and North East(2005-2006).	110
3.1.2.14B	Common cancer in the various PBCR's as per age adjusted incidence Rates.	111
3.1.2.15	Projected Cases of Cancer at India Level for Selected Sites and Selected Time Periods (2008-2010, 2015-2020)	112
3.1.2.16	Average Annual Age Specific Incidence (I) and Mortality (M) Rates Per 100,000 Persons - All Sites of Cancer for all PBCRs	113
3.1.2.17	State/UT wise Percentage of Women and Men Aged 15-49 Using Any Kind of Tobacco, Smoke Cigarettes or Bidis in India by Sex	114
3.1.2.18	Mental Health Case Load in India July 2002 (Latest)	115
3.1.3	Incidence of Deaths due to Accidents in India 2003 - 2009 (Latest)	116
3.1.4	State/UT wise Proportion of Disabled Population by Type of Disability in India 2001 (Census)	117
3.1.5	State/UT wise Cases and Deaths Due to Snake Bite in India 2009 - 2010 (Provisional)	119
3.2	Reproductive and Child Health - State/UT wise	120
3.2.1	Ante Natal Care	120
3.2.2	Percentage of Deliveries Attended by Trained Personnel	121
3.2.3	Percentage of couples using Contraceptives	122
3.2.4	Percentage of Children Breastfed and their Nutritional Status	123
3.2.5	Percentage of Children Immunized	124
3.2.6	Targets and Achievement of Maternity and Child Health Activities 1999-00 and 2009-10 (Provisional)	125
3.2.7	Nutritional Status of Women and Man	126
3.2.8	Percentage of Anaemia among Children and Adults	127
3.2.9	Incidence of Foeticide and Infanticide 2005 – 2009	128
	Executive Summary- Non-Communicable Disease Risk Factor Survey 2007-2008/MOHFW/GOI/2009	129

3. Health Status Indicators

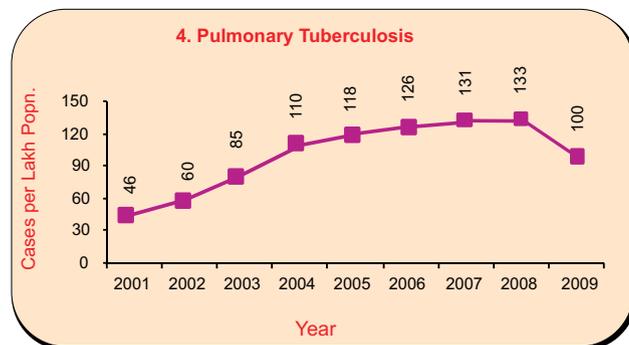

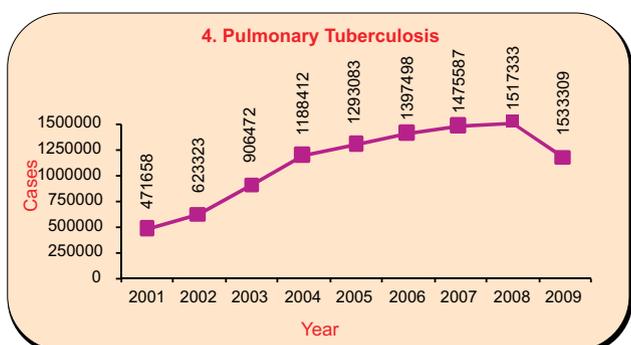

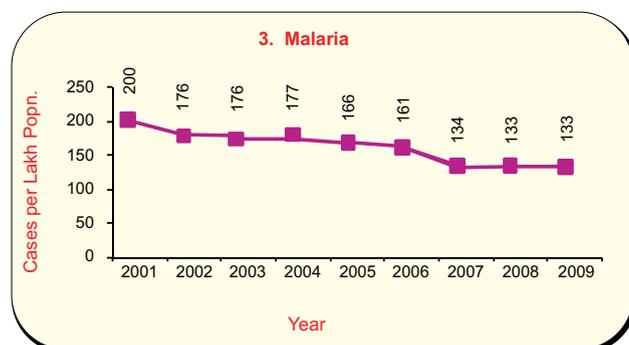

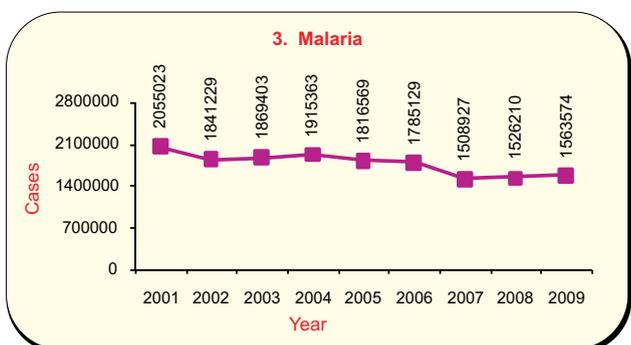

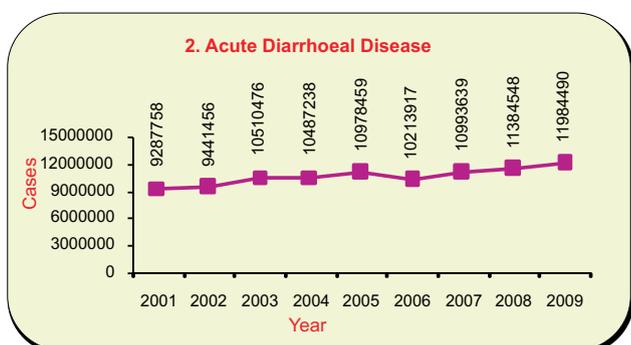

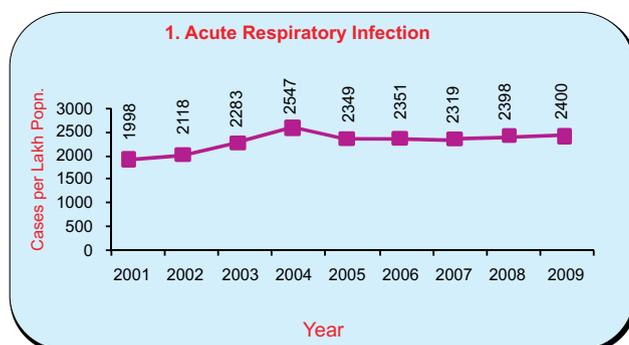

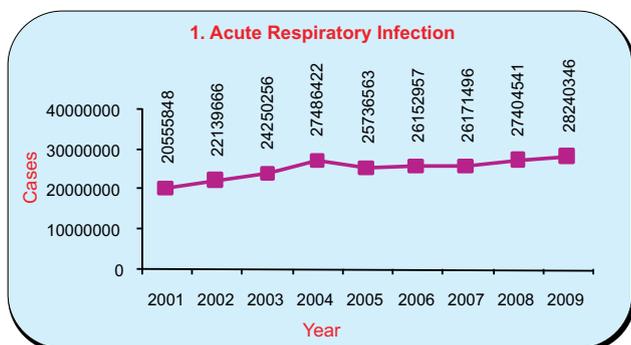

This chapter provides a broad overview on the incidence and prevalence of common Communicable and Non-communicable disease, morbidities & associated mortality, health risks and performance of related national health programmes in the country during the callender year 2010 (January - December). It also provides an overview of reproductive and child health in the country.

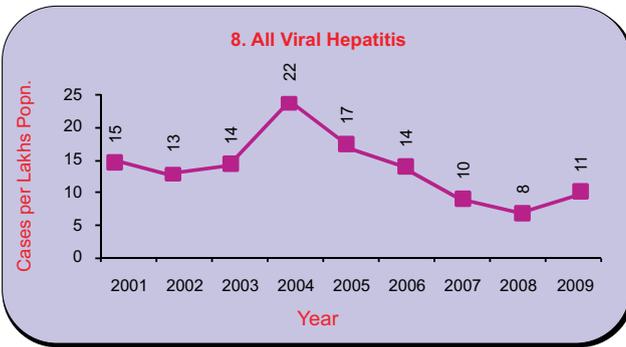

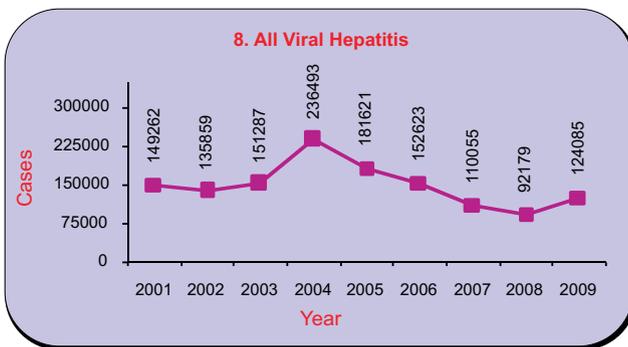

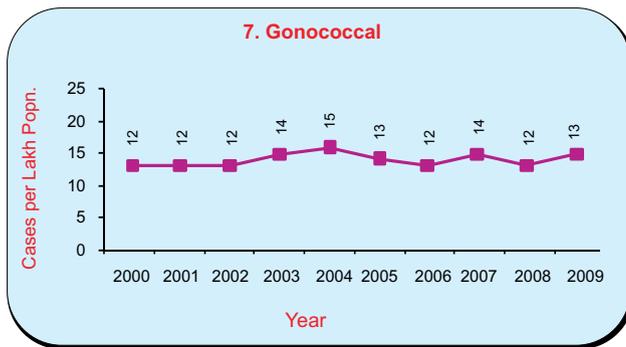

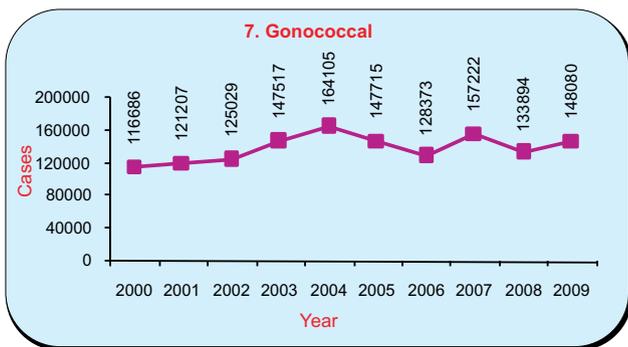

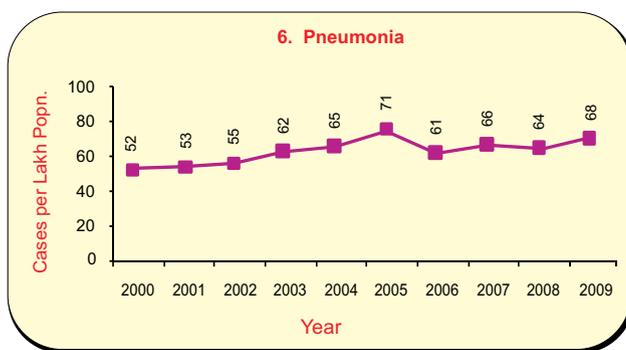

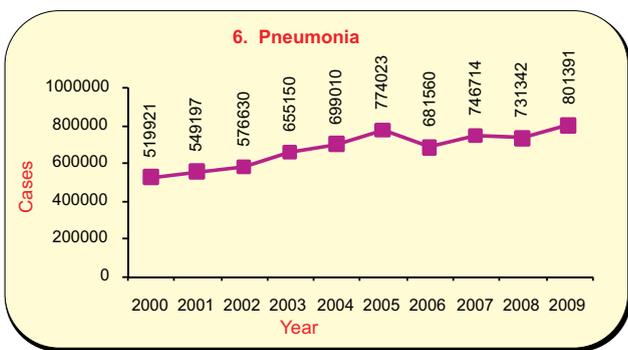

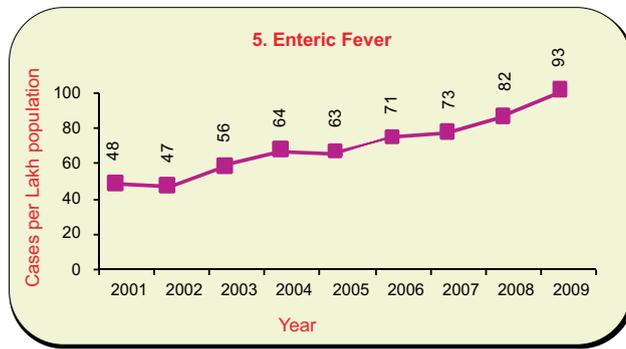

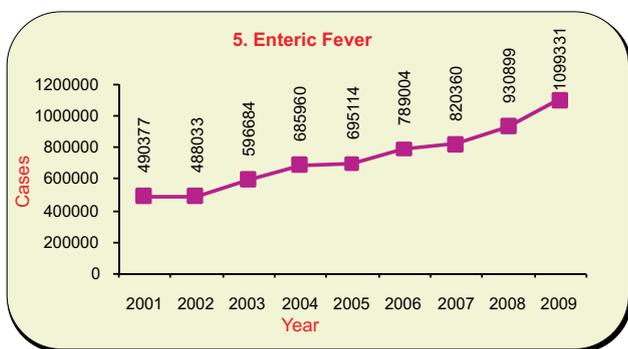

Since the reported Data is by and large from Government Health Facilities, it may have limitations in terms of its completeness as Private Medical & Health Care Institution still need to strengthen their reporting to their respective Government Health units.

- 3.1 Among the various communicable diseases reported by the States/UTs during the year 2010 (Provisional), while taking a cut off one lakh cases; the following communicable diseases accounted for the maximum number of cases reported.

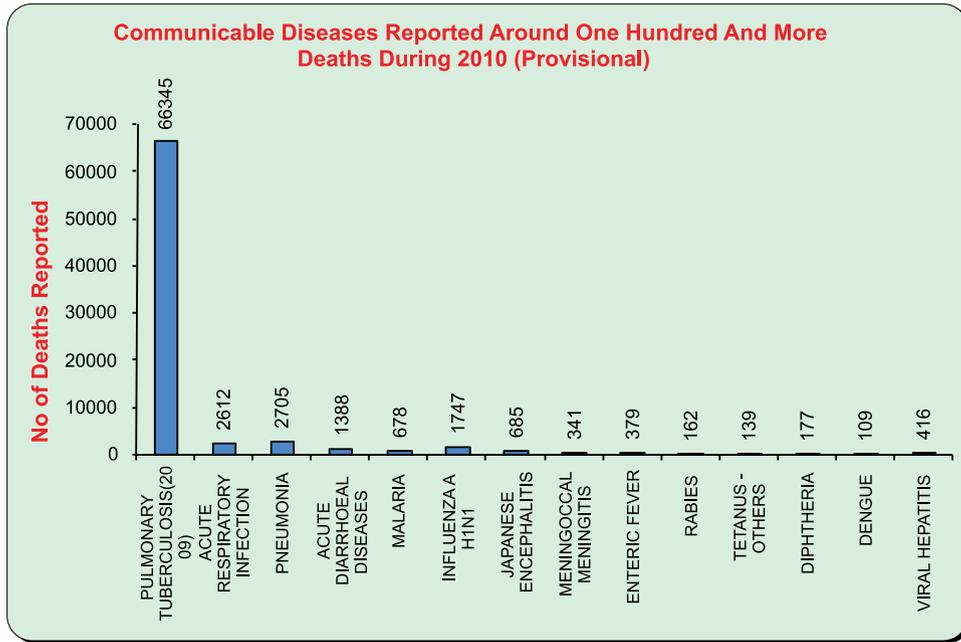

3.1.1 The Morbidity Trend (2001-2009) based on the information received in the past [& revised in succeeding year (s)] from States/UTs, in respect of these eight communicable diseases reporting around one lakh or more cases and corresponding cases per Lakh of Projected Population (as per Registrar General of India Estimates) are shown here under. Since figures for 2010 are still provisional / incomplete, have not been included in the following trend analysis :

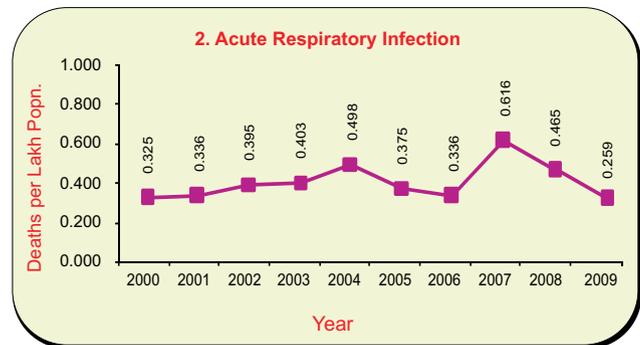

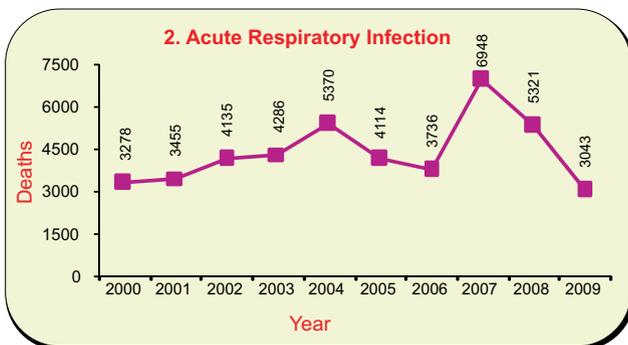

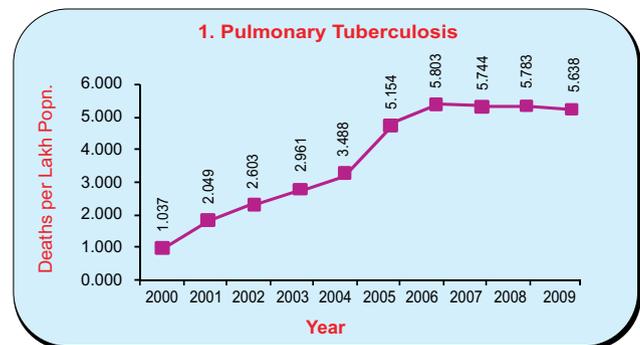

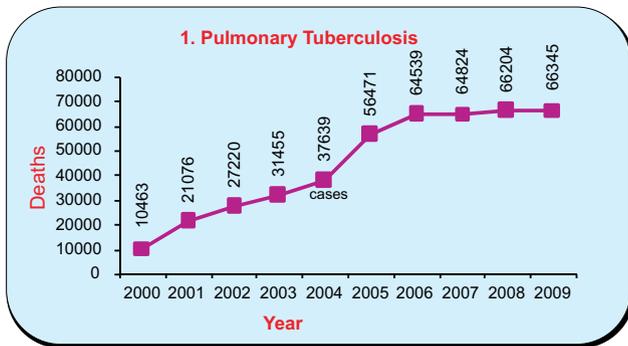

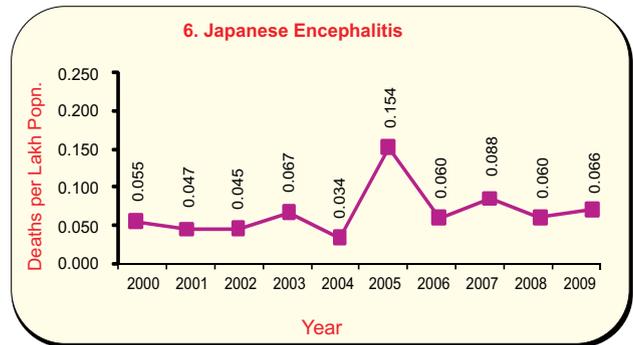

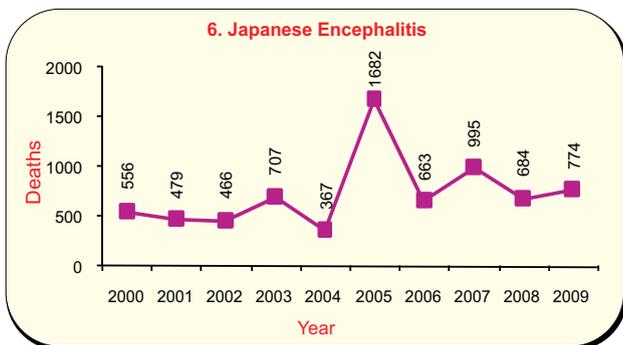

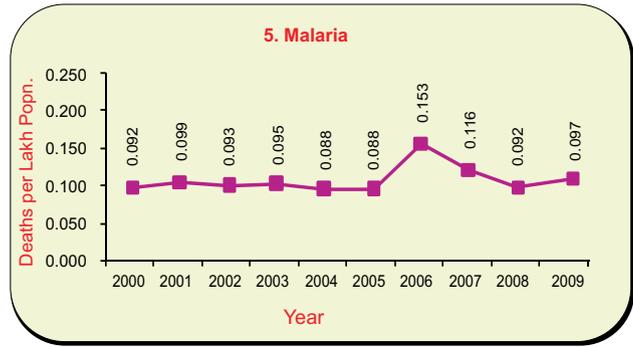

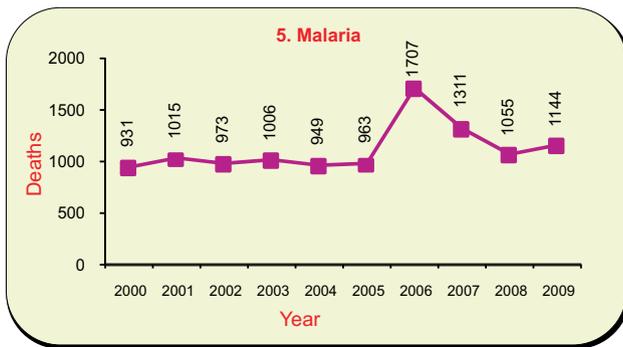

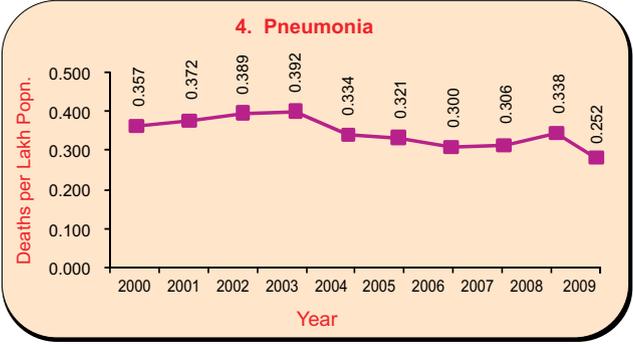

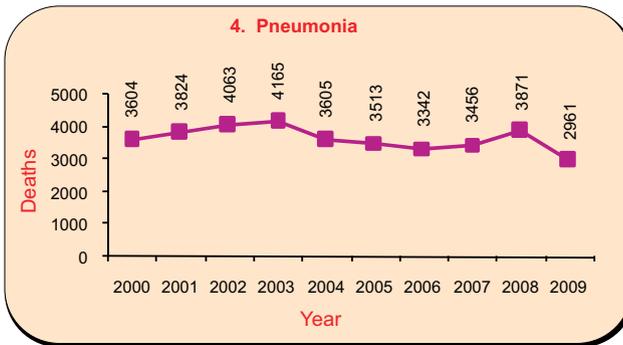

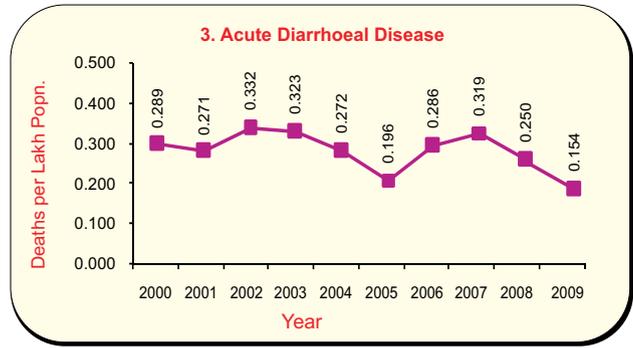

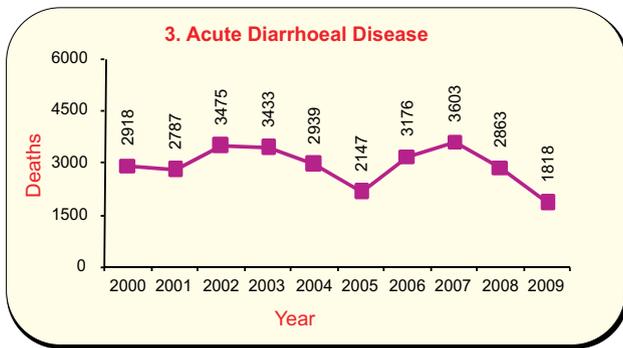

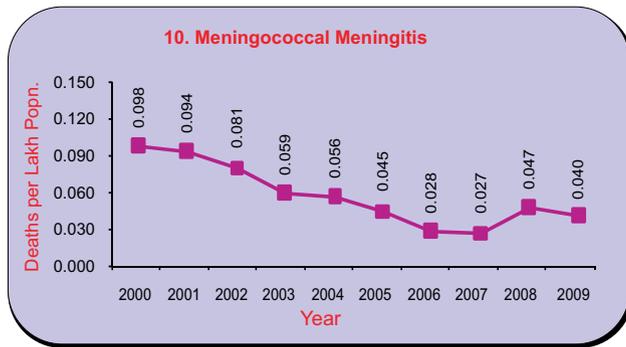

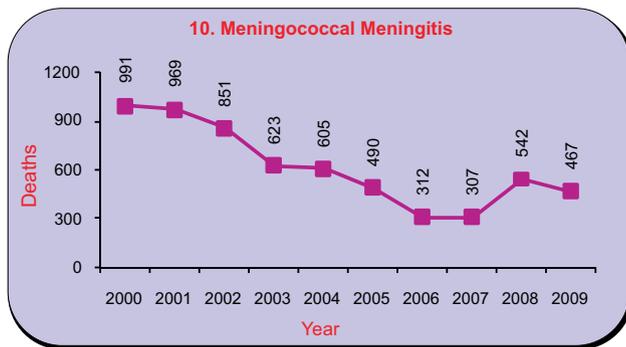

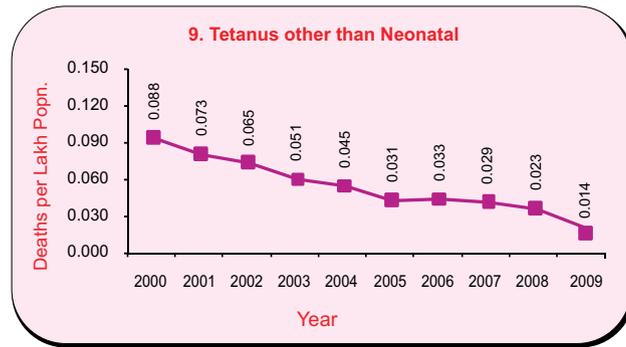

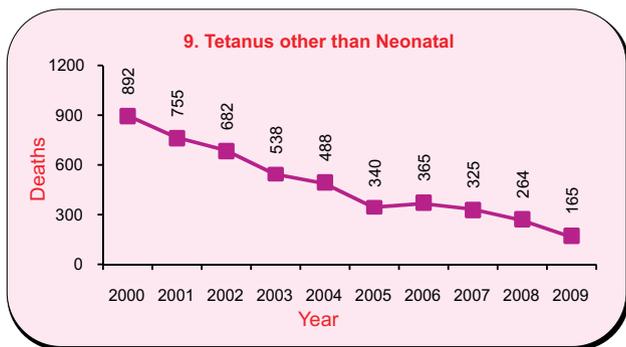

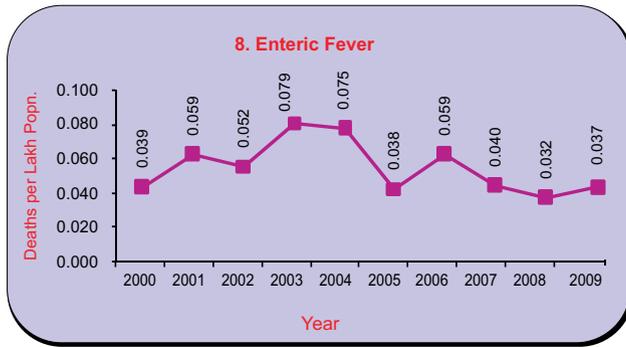

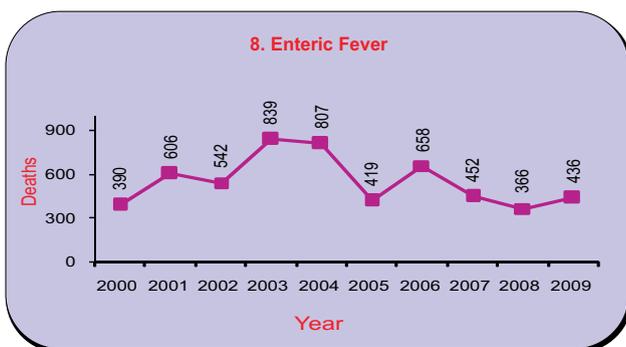

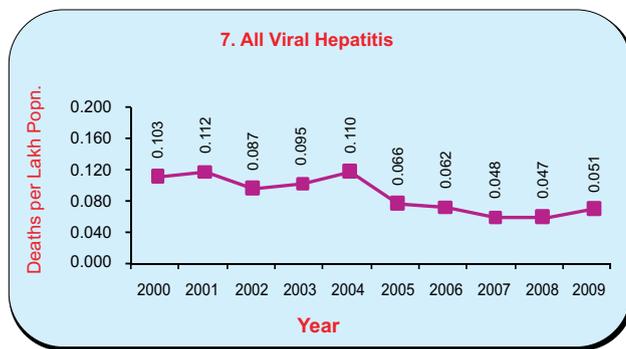

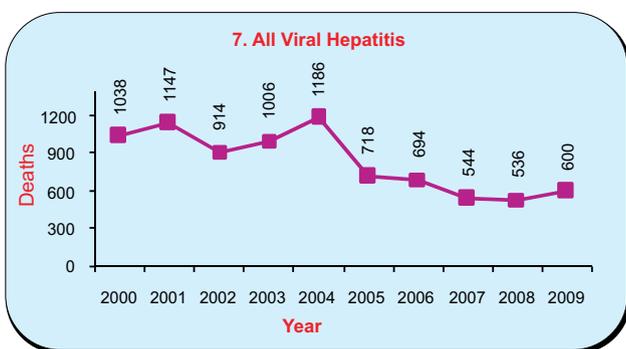

3.2 Among the various communicable diseases reported by the States/UTs during the year 2010, while taking a cut off one hundred deaths, the following communicable diseases accounted for the maximum number of deaths reported.

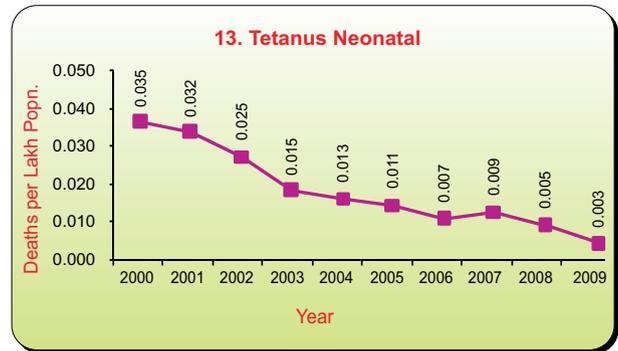

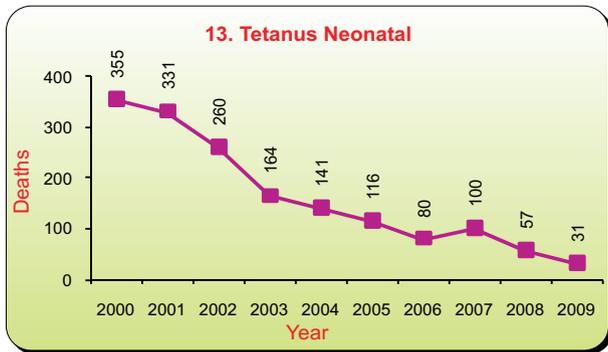

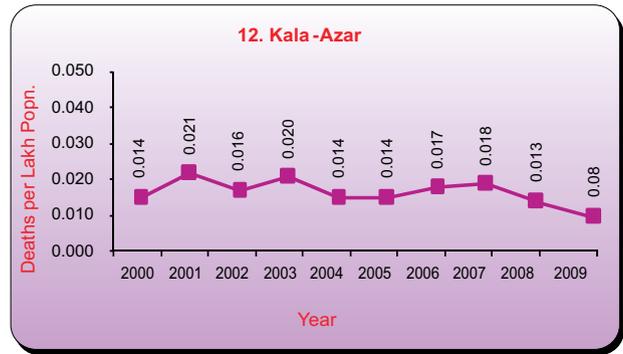

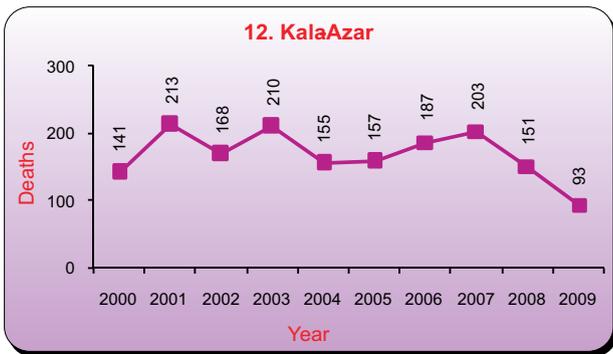

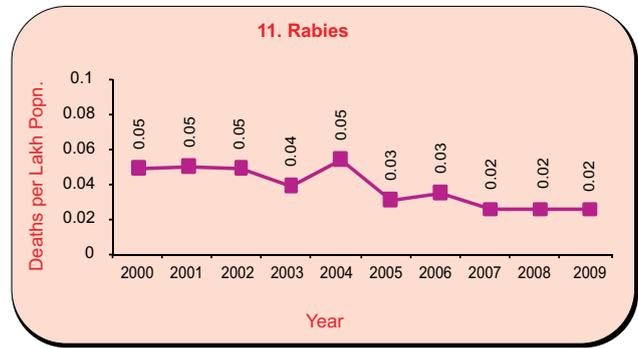

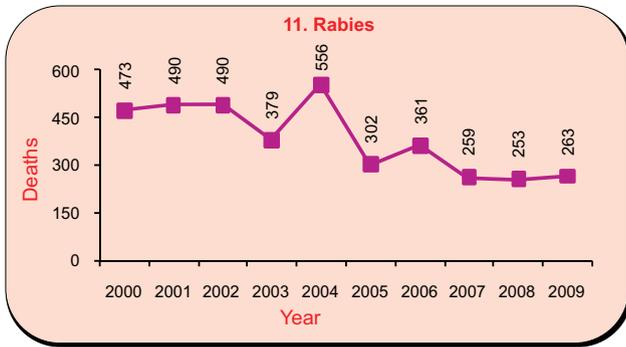

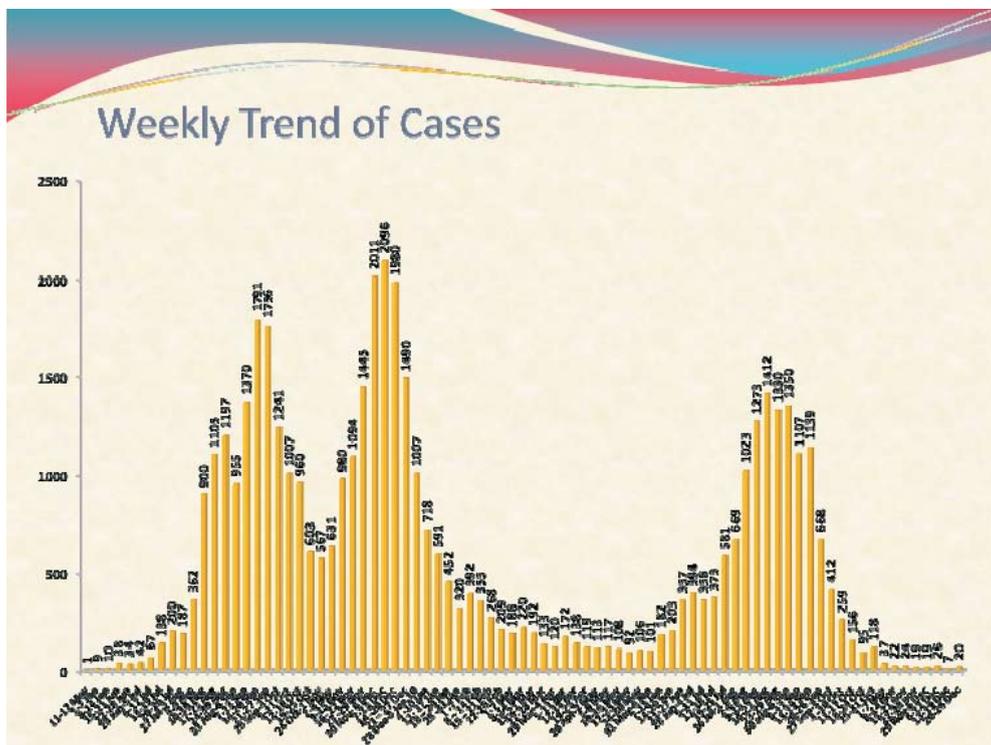

3.2.1 The Mortality trend (2000-2009) based on the information received in the past [& revised in succeeding years (s)] from States/UTs, in respect of these thirteen communicable diseases reporting around 100 or more deaths are and corresponding Deaths per Lakh of Projected Population (as per Registrar General of India Estimates) shown here under. Since figures for 2010 are still provisional / incomplete, have not been included in the Following trend analysis::

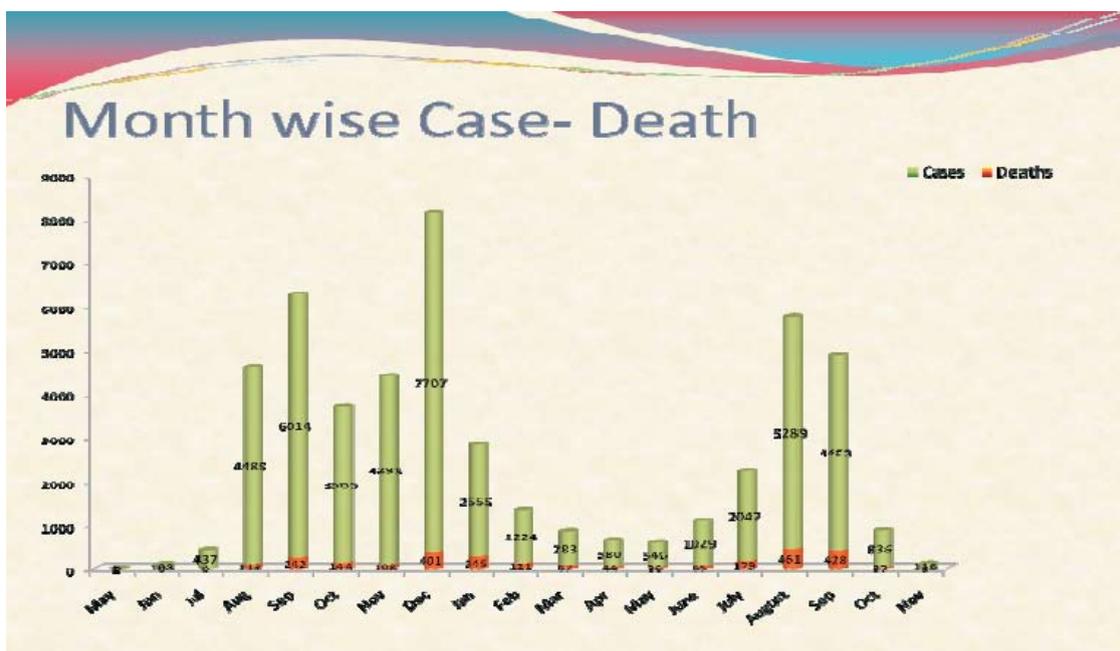

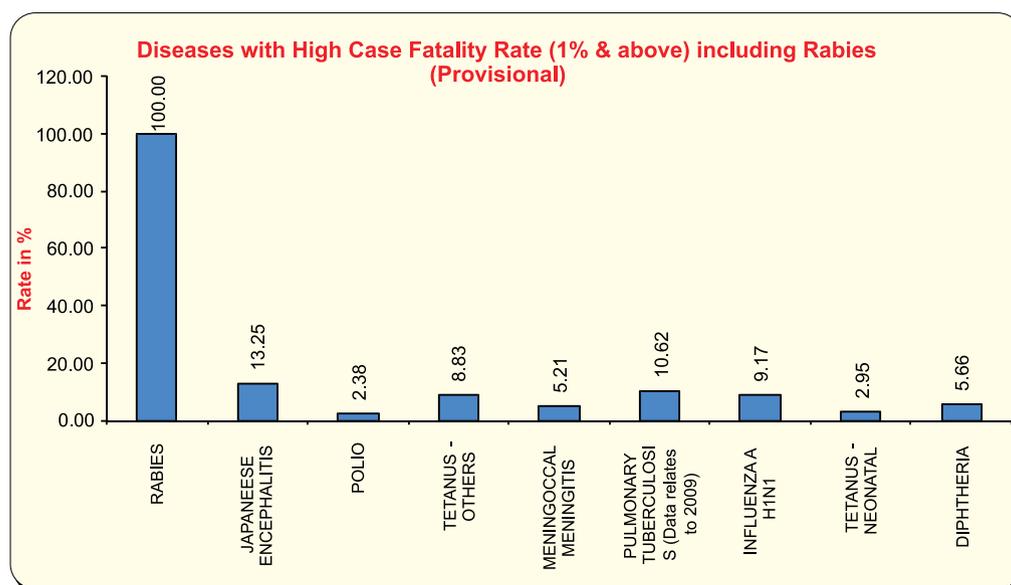

Cumulative Confirmed Cases & Deaths of Pandemic H1N1 2010 by Month

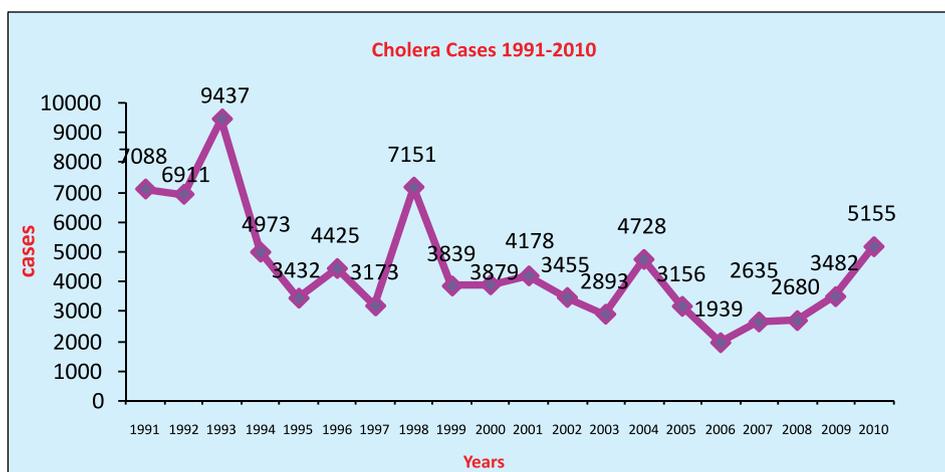

3.3 Disease with High Case Fatality Rate (About 1% and above) during 2010, as reported by the State/UTs.

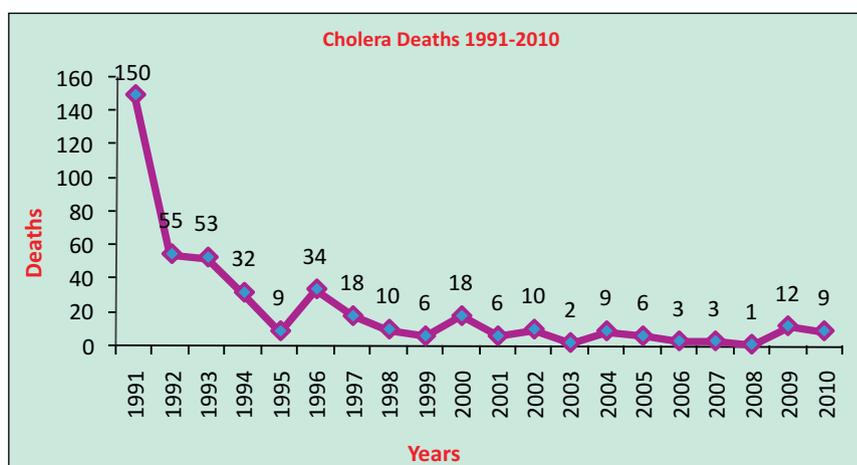

S. No.	Name of the Diseases	Cases	Deaths	Case Fatality Rate (%)
1	RABIES	162	162	100.00
2	JAPANESE ENCEPHALITIS	5171	685	13.25
3	POLIO	42	1	2.38
4	TETANUS - OTHERS	1574	139	8.83
5	MENINGOCCAL MENINGITIS	6547	341	5.21
6	PULMONARY TUBERCULOSIS (Data relates to 2009)	624617	66345	10.62
7	INFLUENZA A H1N1	19046	1747	9.17
8	TETANUS - NEONATAL	373	11	2.95
9	DIPHThERIA	3129	177	5.66

3.4 Cholera data have been compiled on the basis on weekly reports from States/UTs. The annual Cases and deaths due to Cholera in 1991 were 7088 and 150, respectively which now have reduced to 5155 and 09, respectively during the year 2010.

* Data for Year 2010 is based on Information sent by the States/UTs to CBHI, IDSP (Reconciled)

(P): Provisional

Source: Weekly Report from Directorate of Health Services of States/UTs.

3.5 According to National AIDS Control Organization, 604058 patients have ever started ART in the country till 31st December 2010.

3.6 Morbidity due to **non-communicable diseases** accounts for the second largest share of the disease burden in India after Communicable diseases.

- The number of cases of **coronary heart disease** was estimated to be nearly 3.6 crore for the year 2005, which is expected to reach a figure of nearly 6.1 crore cases in the year 2015. **This pattern is nearly same across all adult age groups.** More than half of this rise can be accredited to demographic change but the contribution of increased prevalence of risk factors is also substantial.
- The number of cases of **diabetes** was estimated to be nearly 3.1 crore for the year 2005, which is expected to reach a figure of nearly 4.6 crore cases in the year 2015. **This pattern is nearly same across all adult age groups.** More than half of this rise can be accredited to demographic change but the contribution of increased prevalence of risk factors is also substantial.
- Prevalence rate of **hypertension** in India (Urban + Rural) among adults (20 Year+) = 159.46 per thousand.
- According to estimates for 2007 based on **cancer** registries across the country, cervix and breast cancers accounted for more than 36% of cancer incidence in the country.
- Estimated prevalence of **blindness** in 2004 was 11.2 (10.2 among male and 12.2 among female) per thousand population and is expected to remain more or less the same during the next two decades
- Case-load in respect to major **mental disorders** has been calculated at the rate of 1% of the population and that of minor mental disorders at the rate of 5 % of population.
- There were 357021 deaths due to **accident** reported in the country in the year 2009.(Latest)

3.7 **Reproductive and Child Health, the key finding of the latest National Health Family Survey (NHFS-3), 2005-06, is already attached in this NHP:-**

1. 52% of Indian mothers received three or more ante natal checkups.
2. 40.7% of deliveries were conducted in medical institution while another 48.2% deliveries were assisted by medical professional.
3. 43.5% of children in India received all vaccinations.

Notes:

1 Projected population based on census population of 2009 is used for calculation of case-detection rate, 1 lakh=100,000 population

2 Smear positive patients diagnosed include new smear positive cases and smear positive retreatment cases

3 Total patients registered for treatment includes new sputum smear positive cases, new smear negative cases, new extra-pulmonary cases, smear positive retreatment cases and 'Others'

• Detailed state/district wise annual and quarterly performance reports available at www.tbindia.org

Notes:

- * NA : Not Available
- * HIV Prevalence values in States with more than 3 sites are median values, while in States/UTs with 3 or less than 3 sites, the values are mean values.
- * Sites with 75% coverage of desired sample size (STD: 250 & ANC:400) are included for analysis.

Note:

- Only 2005 data
- As per the registry of 2004-05, the leading site of cancer among males is lung Cancer followed by Cancer Stomach. Among females, Breast Cancer is the leading site of cancer followed by Cancer Cervix. In the North East, Stomach Cancer is the leading site among males followed by Oesophagus Cancer, Lung Cancer and Liver Cancer. Among the females though Breast and Cervix Cancer is the leading site, in Imphal & Mizoram the leading site is Lung Cancer, Stomach Cancer in Mizoram and Oesophageal Cancer in Silchar.

Notes

@ The population figures haven been taken from the Census of India-2001 as published in Provisional Population Totals (Registrar General Census Commissioner, India).

\$ Population density per sqare Kilometre together with geographical terrain is a useful input in planning deployment of mental health resources.

Case-load in respect to major mental disorders has been calculated at the rate of 1% of the population and that of minor mental disorders at the rate of 5 % of population.

Information related to infrastructure is available in Chapter IV

Source: National Survey of Mental Health Resources carried out by the Directorate General of Health Services, Minisitry of Health and Family Welfare, Government of India, during May and July 2002 and published in Mental Health An Indian Perspective 1946-2003 DteGHS/MOHFW/GOI.

Foreword

Globally, non-communicable diseases (NCDs) are the major cause of morbidity and mortality. According to WHO Report 2004, they account for almost 60% of deaths and 47% of the global burden of disease. In India, estimated deaths due to non-communicable diseases were double than those from communicable diseases. A progressive rise in the disease pattern of NCD foretells a serious public health issue. The major risk factors for non-communicable diseases are tobacco and alcohol abuse, a sedentary lifestyle, and an unhealthy diet. It is believed that about half of non-communicable disease-related premature deaths could be prevented through healthy diet, regular physical activity and by avoiding tobacco and alcohol.

Envisaging the magnitude of the public health problem of chronic diseases, the Government of India through National Institute of Communicable Disease, MoHFW and Indian Council of Medical Research initiated NCD risk factors survey, phase-I in seven states of India. It is a well planned large community based survey providing state wise estimates of major NCD risk factors in different strata of population. It is needless to mention that the estimated NCD risk factors are important input for targeted prevention of NCD and effective health care planning. The National Technical Advisory Committee (NTAC) and National Monitoring Committee constituted by MoHFW, provided valuable technical guidance and support to complete the study.

The Indian Council of Medical Research through its Division of Non-communicable Diseases has implemented the study with all the partners including the National Institute of Medical Statistics as a National Nodal Agency, Regional Resource Centers and State Survey Agencies.

I congratulate the Team for successfully completing the survey and bringing out Phase-I report of NCD Risk Factors which would be of immense use for prevention and control of non-communicable diseases.

Preface

Non-Communicable Diseases (NCD) account for a large proportion of morbidity and mortality amongst the adult population of our country. The high prevalence of major risk factors viz. tobacco and alcohol consumption, inappropriate diet, physical inactivity, high blood pressure, high blood glucose and dyslipidemias are driving the epidemic of NCDs. The Division of Non-Communicable Diseases at ICMR was identified as the nodal point for surveillance of NCDs and their risk factors by the World Health Organization, and multi-site studies helped us in developing a sound strategy for NCD risk factor surveys at the national level under IDSP. The survey methodology developed by ICMR was incorporated by IDSP into the overall survey protocol provided to ICMR for implementation.

The Indian Council of Medical Research signed a Memorandum of Understanding (MOU) with IDSP for the standardization and quality assurance of the NCD risk factor surveys under the World Bank funded IDSP on behalf of Ministry of Health, Govt. of India. As per IDSP plan, these surveys were to be carried out in three phases so as to cover all States and UTs of the country. In the present Phase I, the State based estimates of the risk factors in seven States (Andhra Pradesh, Kerala, Madhya Pradesh, Maharashtra, Mizoram, Tamil Nadu and Uttarakhand) were arrived at through the IDSP identified seven State Survey Agencies, five Regional Research Centers and a National Nodal Agency under the overall guidance and supervision of ICMR Headquarters through the National Technical Advisory Committee. I am grateful to the Director General, ICMR for supporting the Division of Noncommunicable Diseases ICMR to implement the surveys. The untiring effort of our partner agencies is commendable and is duly acknowledged.

This report marks an important milestone in surveillance activities for NCDs in the country. The results would be useful for planning and monitoring an effective response in a coordinated manner by the Government. It should also stimulate further analysis and research in the area.

(Dr. Bela Shah)

Executive Summary

Introduction

The Government of India through the Ministry of Health & Family Welfare (MOHFW) initiated a decentralized, state based Integrated Disease Surveillance Project (IDSP) in the country with the assistance of the World Bank in the year 2004. The component of non-communicable disease surveillance planned periodic community based surveys of population aged 15-64 to provide data on the risk factors. It is in line to help the state health administrators to plan strategies for the control of non-communicable diseases by modifying the risk factors. All Indian states were proposed to be surveyed in a phased manner under the project. The first phase of the survey included seven states namely Andhra Pradesh, Kerala, Madhya Pradesh, Maharashtra, Mizoram, Tamil Nadu and Uttarakhand.

The overall objective of the NCD risk factors survey was to improve the information available to the Government health services and care providers on a set of high-priority risk factors, with a view to improve the quality health care and services. The survey also aimed to establish the baseline database of NCD risk factors needed to monitor trends in population health behavior and risk factors for chronic diseases over time. This would provide evidence for evolving strategies and interventions for identified risk factors in the community to reduce the burden of non-communicable diseases.

A National Technical Advisory Committee was constituted to provide the technical guidance to the survey and a National Monitoring Committee was formed for monitoring the overall progress of the project. Indian Council of Medical Research was the implementing agency while the National Institute of Medical Statistics (NIMS) was appointed as the National Nodal Agency (NNA) for coordinating the survey. Five medical institutes/ colleges were selected as a Regional Resource Centre (RRC) for monitoring the quality of data collection and technical support to State Survey Agency (SSA) of seven states selected in the first phase for conducting the survey.

Survey Methodology

WHO STEPS methodology for NCD Risk Factor Surveillance has been adopted for the survey after

carrying out suitable modifications, based on a multi-site ICMR-WHO collaborative initiative for NCD risk factor surveillance¹. The survey was designed to provide prevalence estimates of risk factors for each 10 years age group (15-24 through 55-64) by sex (male/female) and place of residence (urban/rural). The survey used uniform sample design, bilingual schedules (English and the regional language of the state concerned), field protocol for data collection and physical measurements to facilitate comparability across states and also to ensure high quality data. For the present survey, appropriate sampling weights for households were used for urban and rural areas of the state. From each selected household one member aged 15-54 was selected using the KISH Method and all members aged 55-64 were selected. Such post stratification was used for improvement of efficiency of the estimators. For each state, post stratification weights for individuals were constructed using the age distributions by sex.

Two types of questionnaires - one at household level and another for individual level were used for the survey. At household level, information was elicited on religion, household facilities, ownership of agricultural land and livestock, and possession of durable goods for each selected household. The Individual questionnaire collected information from the selected individuals regarding demographic, behavioral and physical measurements. The individual questionnaire was divided into two segments based on WHO STEP methodology. The first section (Step-1) collected the demographic information of individuals including age, sex, marital status, education, and occupation. In the behavioural information section, information about tobacco use, alcohol consumption, diet, physical activity, history of raised blood pressure and history of diabetes were collected. In the second section (Step-2), physical measurements of individual such as height, weight, waist circumference (not measured for pregnant women), blood pressure, and pulse rate were recorded.

Characteristics of survey population

A total of 5000 households were contacted in urban and rural area of each of the seven states. The overall household response for the survey ranged from 88.6%

in Kerala to 99.9% in Madhya Pradesh and Maharashtra. More than four-fifth (82%) of the households were Hindu in all the states except Mizoram and Kerala. In Mizoram, 92% of the households were Christian whereas in Kerala, 56% were Hindu, 23% Muslim and 20% Christian.

Four in every five households in Andhra Pradesh, Maharashtra, Uttarakhand and Tamil Nadu used drinking water from a piped or hand pump whereas 73% of households in Madhya Pradesh, 70% of households in Mizoram and 28% of households in Kerala used such drinking water. Almost all the households in the seven states under study had flush or pit toilet facility. More than 90% of households in all the states except Madhya Pradesh and Uttarakhand had electricity as the main source of lighting. Three quarter households in Uttarakhand and more than two third households in Madhya Pradesh, had electricity as main source of lighting. More than half of the households in Maharashtra and Mizoram were using LPG as cooking fuel and in rest of the states it varied from a low 19% of households in Madhya Pradesh to a high 38% in Kerala. The use of wood as cooking fuel was prevalent in 72% of households in Madhya Pradesh, 65% of households in Andhra Pradesh, 61% of households in Kerala and 57% of households Uttarakhand and Tamil Nadu. Over half of the households in Madhya Pradesh and Uttarakhand had own agricultural land. However, it was only 15% in Kerala and 30-40% in rest of the states.

The percentage of illiterate respondents ranged from a low 9% in Mizoram to a high 45% in Andhra Pradesh. Between 67-77% of the respondents were currently married in all the states except Mizoram where it was only 53%. Majority of the respondents in all the states were engaged in agriculture, domestic or manual work.

BEHAVIOURAL RISK FACTORS FOR NCD

Tobacco Smoking

As per the WHO STEPS guidelines, the smokers are presented into the categories of *Current Smokers*, *Current*

Daily Smokers, *Past Daily Smokers* and those who have never smoked in lifetime are classified as *Non-Smokers*. The percentage of current daily smokers varied between a low 9% in Maharashtra and high 42% in Mizoram.

The mean number of smoking *beedis* ranged from a low of 3 in Maharashtra to a high of 14 in Uttarakhand. The mean number of smoking manufactured cigarette in a day was low in Madhya Pradesh (<1) and a high 11 in Mizoram. The average age of onset of smoking ranged from 17 years in Mizoram to 20 years in Maharashtra, Kerala and Tamil Nadu and in rest of the states it was 19 years.

In Andhra Pradesh, Kerala, Tamil Nadu and Uttarakhand, 4-12% respondents were current daily users of smokeless tobacco. In rest of the states, it ranged from 32-48%. The mean frequency of chewing

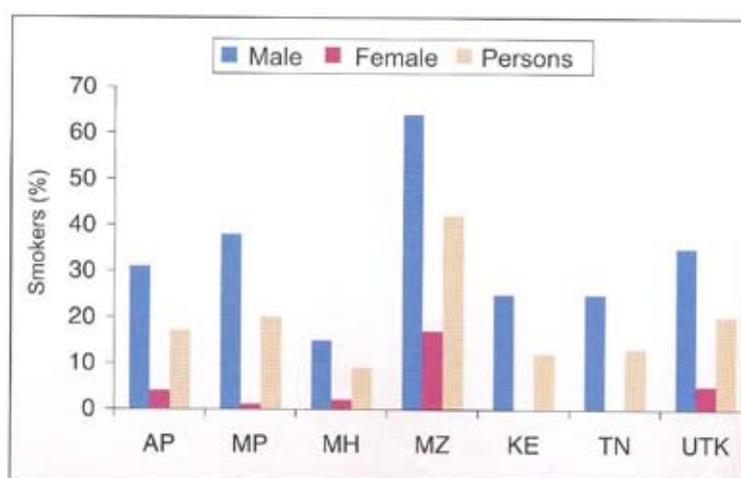

Figure 1. Current daily smokers (%) by sex and phase-I states

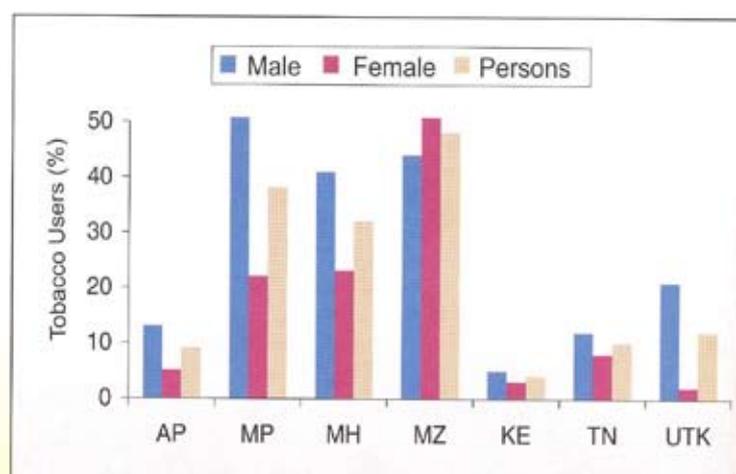

Figure 2. Current smokeless tobacco users (%) by sex and phase-I States

tobacco in a day ranged from less than 1 in Kerala and Andhra Pradesh to 10 in Mizoram. The mean frequency of chewing pan with tobacco ranged from a low <1 in Madhya Pradesh and Maharashtra to a high 9 in Mizoram. The mean age of initiation of smokeless tobacco use was 18 years in Mizoram and 20 years in rest of the states among young respondents (15-34 years).

Alcohol Consumption

In the survey, percentage of the respondents reported to have consumed alcohol in past 12 months ranged from a low 11% in Mizoram to high 20% in Andhra Pradesh. Except Andhra Pradesh and Kerala, the prevalence of alcohol consumption was higher among rural respondents than their urban counterparts. The average number of standard drinks consumed on a drinking day ranged from a low of 2 in Madhya Pradesh and Maharashtra to a high 8 in Uttarakhand. The mean age of initiation of alcohol consumption regularly in the age group 15-34 years was 20-22 years in all the seven states.

Fruits and Vegetables Consumption

In a week, people consumed vegetables 4-7 days and fruits only 2-3 days in all the states. The mean number of days in a week, when fruits were consumed, was higher among urban population as compared to rural. There was not much difference between urban and rural respondents in the mean number of days consumed vegetables in a week. The percentage of respondents consumed less than five servings of fruits and vegetables per day ranged from a low 76% in Maharashtra to high 99% in Tamil Nadu.

The edible oil used commonly for cooking were mustard and soyabean oil in Madhya Pradesh, Mizoram and Uttarakhand; groundnut, soyabean and palm oil in Andhra Pradesh and Tamil

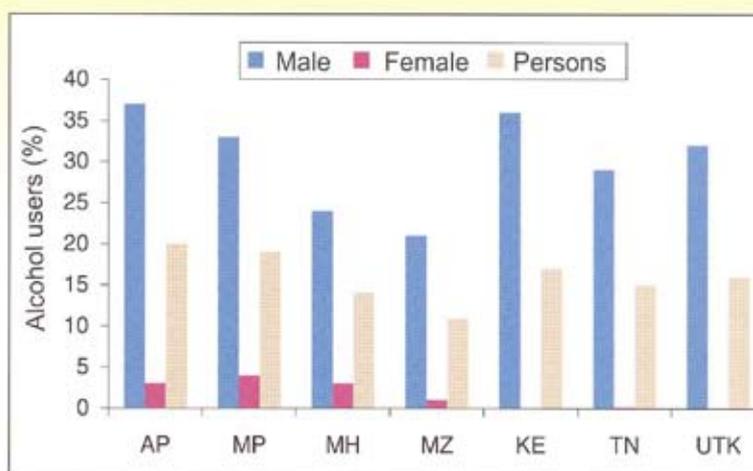

Figure 3. Respondents consumed alcohol in last 12 months (%) by sex and phase-I states

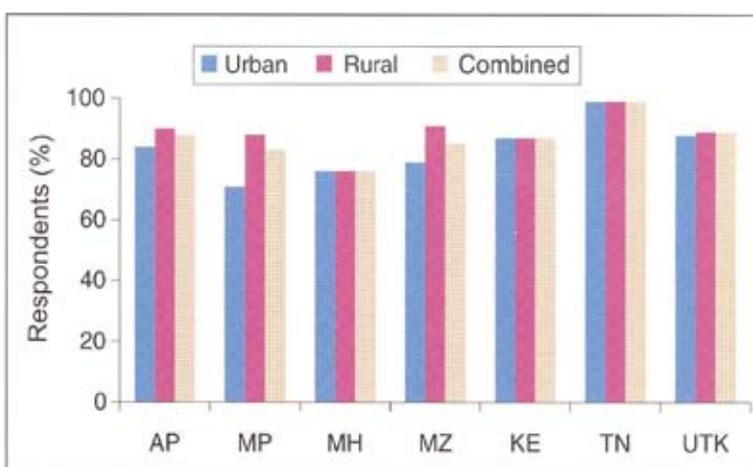

Figure 4. Respondents consumed less than five servings of fruits & vegetables (%) per day by residence and phase-I states

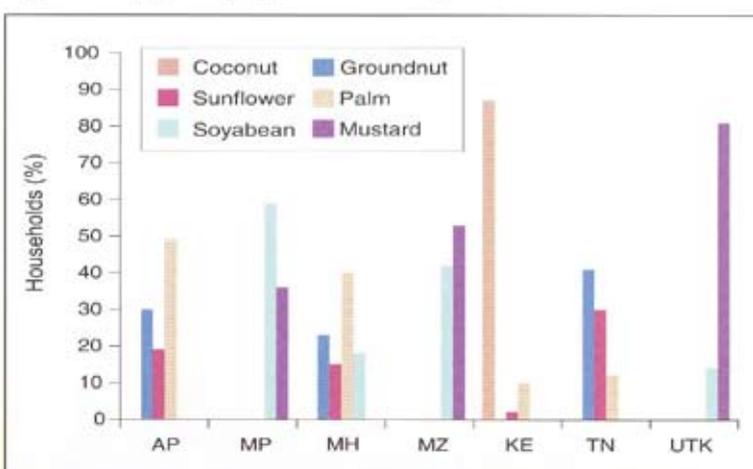

Figure 5. Type of oil consumption among the households for cooking (%) in phase-I states

Nadu. In Maharashtra, the edible oil used commonly were groundnut, soyabean, palm and sunflower oil. Coconut oil was the only edible cooking oil used commonly in Kerala.

Physical Activity

The lack of physical activity leads to obesity, hyper-lipidemia, diabetes mellitus, hypertension, and coronary heart disease. The present survey found that the mean time spent on work related physical activity ranged from a low 128 minutes per day in Maharashtra to a high 293 minutes per day in Madhya Pradesh. Most time spent was mainly related to work only. The mean time spent in travel related activities (cycling/walking) ranged from a low 31 minutes per day in Andhra Pradesh to a high 69 minutes per day in Uttarakhand. The survey also reported that the mean time spent in recreational activities was low (4 minutes per day) in Andhra Pradesh and high (67 minutes per day) in Madhya Pradesh.

As per the WHO guidelines, the total physical activity of the individual has been categorized as low, medium and high. The proportion of respondents reporting low physical activity was lowest (42%) in Madhya Pradesh and highest (81%) in Maharashtra.

HYPERTENSION AND DIABETES

Hypertension

The blood pressure is an important determinant of risk of cerebrovascular and ischemic heart diseases, congestive cardiac failure and renal failure. In the survey, the reported cases of hypertension diagnosed by health professionals, ranged from 2% in Madhya Pradesh to 9% in Kerala. Among those who were diagnosed with hypertension, majority of them were on prescribed drugs. The advice on dietary modification and lose weight ranged from a low 22% to high 71% in all the states. A low 1% of such cases in

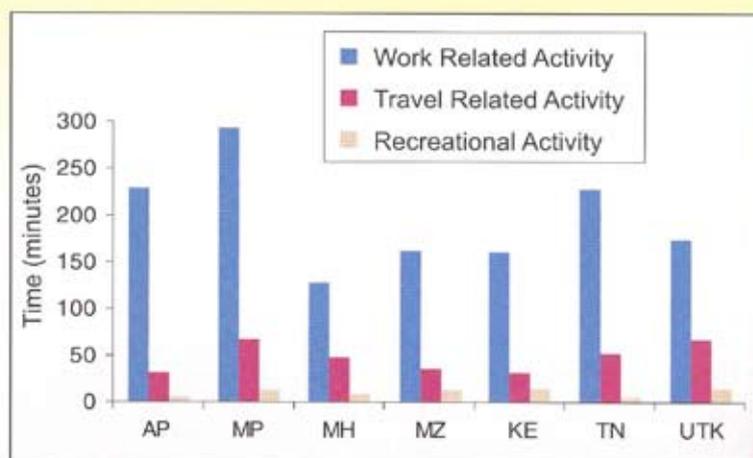

Figure 6. Mean time spent on physical activity per day (minutes) in phase-I states

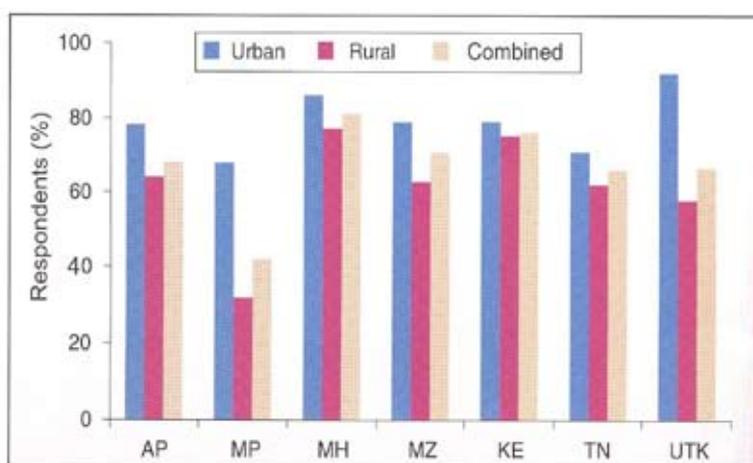

Figure 7. Low physical activity of respondents (%) by residence and phase-I states

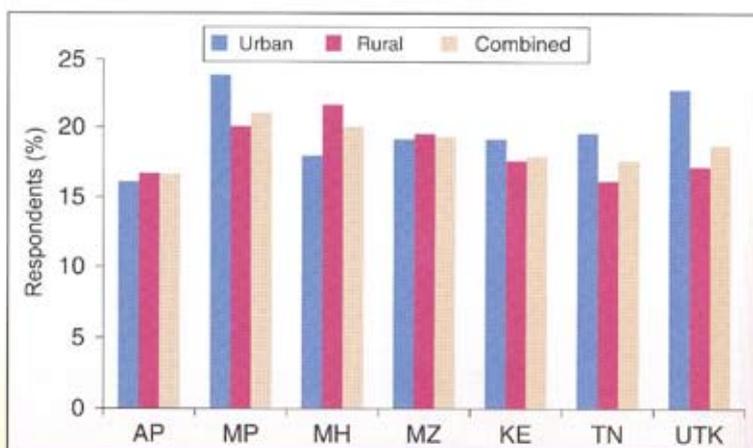

Figure 8. Stage I & II hypertension (%) by residence and phase-I states

Madhya Pradesh to high 22% in Maharashtra consulted AYUSH practitioners. Of those consulted AYUSH, a low 24% in Madhya Pradesh to high 81% in Uttarakhand were taking treatment from the same. The survey also carried out measurement of blood pressure as a part of step-2 of individual questionnaire. The mean systolic blood pressure in the population ranged from 123 mm Hg in Maharashtra and Andhra Pradesh to 126 mm Hg in Madhya Pradesh. Mean diastolic blood pressure ranged from 77 mm Hg in Andhra Pradesh and Kerala to 81 mm Hg in Mizoram. By categories of hypertension, 17-21% of the respondents in all the states were found in stage I or stage II hypertension.

Diabetes

Diabetes mellitus is an important marker of risk for the arterial disease of the coronary, cerebral and peripheral arterial trees, and for micro vascular disease leading to blindness and renal failure. The survey also included information on history of diabetes. A low 1% of the respondents in Mizoram, Madhya Pradesh and Maharashtra and high 6% in Kerala reported to have history of raised blood sugar. Of which, 12-46% were taking insulin and 66-87% were on oral drugs. A large number of them were advised life style modification such as diet modification, lose weight and increase physical activity. About a low 3% and high 31% (of the diagnosed) in all the states had consulted AYUSH practitioners for the elevated blood sugar levels and the compliance to the prescribed treatment of system ranged from 58-93%.

PHYSICAL MEASUREMENTS

Body Mass Index (BMI)

World wide researches have shown that there is a strong association between BMI and health risk. On the other hand, low BMI is an indicator of risk to health, often being associated with tobacco, alcohol use and drug addiction. The survey recorded height, weight and waist circumference of the surveyed individuals. The

mean BMI in all the seven states ranged between 20 to 23 kg/m² with mean height ranging from 157 to 160 cm and mean weight 50 to 58 kg. The respondents in under weight category were 14% in Mizoram 15% in Kerala and 39% in Madhya Pradesh. In other four states, respondents in the underweight category ranged from 23 to 28%. The grade I overweight was only 7% in Madhya Pradesh closely followed by 9% in Mizoram, 11% in Uttarakhand and Maharashtra where as it was 15% in Andhra Pradesh, 18% in Tamil Nadu and 22% in Kerala. The obesity of grade 2 and above was around 5% in Tamil Nadu, Andhra Pradesh and Kerala and it was around 2 to 3% in rest of the states.

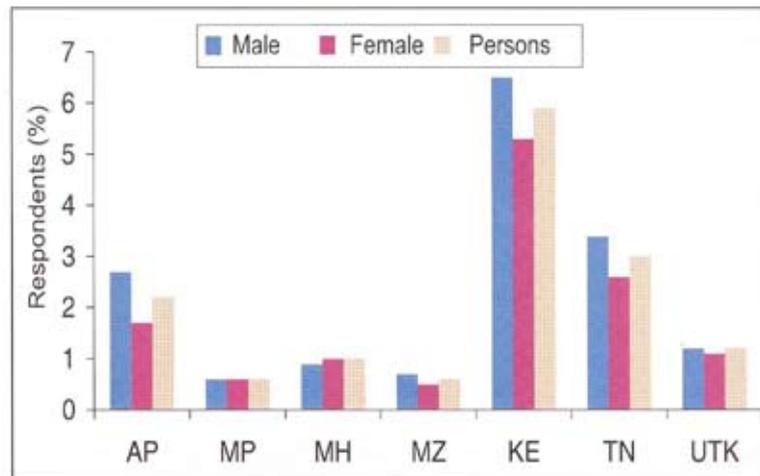

Figure 9. History of raised blood sugar (%) by sex and phase-I states

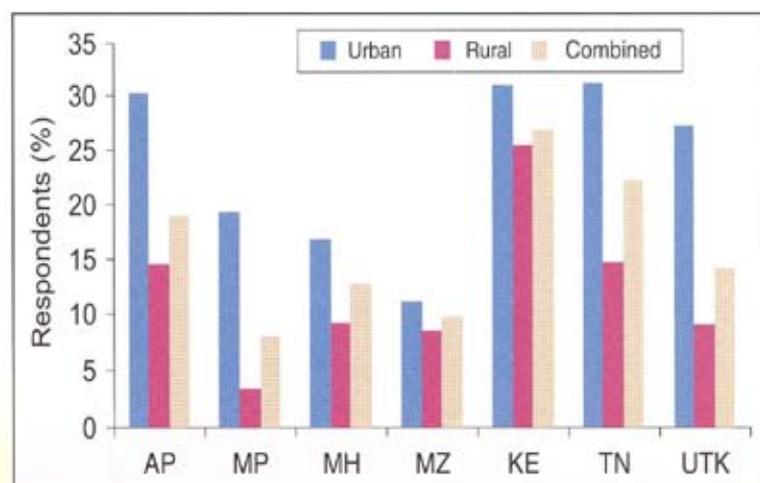

Figure 10. Overweight respondents (%) by residence and phase-I states in India

SOCIO-DEMOGRAPHIC DIFFERENTIALS

Tobacco is mainly used as smoking and other smokeless forms in different states of India. In phase-I states, the prevalence of smoking was recorded high in Mizoram (44%) followed by Madhya Pradesh (22%) and Uttarakhand (20%). The increasing pattern of prevalence of smoking was recorded with increasing age group of respondents in all the states. Overall, the prevalence was declining with increasing levels of education in all the states. Prevalence of smoking among female respondents was very low compare with males in all the phase-I states except Mizoram. Occupation is an important socioeconomic indicator. The differences in prevalence of smoking were higher from one category of occupation to another. Prevalence of smoking in the occupational categories of manual work, service and agriculture was high in most of the states compare with other categories. A similar pattern of increasing in prevalence of smokeless tobacco users with age and decreasing with level of education was also observed in all the seven states. The prevalence of current alcohol drinkers was high among the adult population (25-44) which was declining in the older age group (55-64). The habits of tobacco and alcohol use starts at early young age which contributes to the high risk of NCD at productive stage of life or as grown older with such habits.

The fruits and vegetable consumption and regular physical activity reduce the risk of non-communicable diseases. But, the study indicates high proportion of population taking inadequate amount of fruits and vegetables (less than five servings of fruits and vegetables per day) in all the seven states. Prevalence of low consumption was high in all the states such as Tamil Nadu (99%), Uttarakhand (89%), Andhra Pradesh (88%), Kerala (87%) and others (76% to 85%). Marginal differences in prevalence were observed in age groups, levels of education, occupation and residence. However, more than half of the population was found in the category of low physical activity in almost all the states except Madhya Pradesh. The differences in the pattern of low physical activity by age, sex, education, occupation and residence were also observed. Among the older (55-64) and younger age groups (15-24), the people were doing less physical activity as compare with

other age groups. Female respondents were more in low physical activity compare with males across all the age groups. However, rural people were doing more physical work than urban and a similar pattern was observed across all age groups. The physical activity by education was observed low among higher levels education whereas it was comparatively high among lower levels. Occupational difference in physical work activity was also observed across all the categories. The people whose occupation was agriculture and manual work were doing more physical work compare with other occupational categories in all the seven states. Low physical activity was high among domestic worker, executive and business occupation in most of the states.

Hypertension is a major non-communicable disease risk factor especially related to cardiovascular disease. Prevalence of hypertension was varying from 17% to 21% in all the states with marginal rural-urban differences. Overall, pattern of prevalence was found increasing with age groups in all the states. Though hypertension was prevalent in all education levels, but it was high in the higher education levels of Uttarakhand, Mizoram and Madhya Pradesh. Hypertension was prevalent in all the occupational categories, but it was comparatively higher among the executive and service categories in all the states.

Overweight (obesity) is a major risk factor of Non-communicable diseases. High prevalence of overweight was recorded in all the age groups except the younger age (15-24). Prevalence of overweight was higher among females compare with males across all the age groups. Prevalence was also higher in urban population compare with rural. Low prevalence of overweight was recorded among lower level of education (illiterate and primary). Prevalence was recorded low among the people whose occupation was agriculture or manual work whereas it was high in other categories of occupation.

Overall, NCD risk factors were prevalent across all the socioeconomic and demographic categories of population in phase I state.

The results generated through this IDSP-NCD survey would certainly focus on major issues in bringing about change or initiate various programs related to control of non-communicable diseases.
